Inequality and Policy Changes: The Case of a Decline in Inflation in open Economies

November 7, 2014, 14h30, ISCTE-IUL, Auditorium Afonso de Barros (Ala Autónoma)

Bernardino Adão
Economist at the Economic Research Department of the Bank of Portugal

Bernardino Adão is economist at Economics and Research Department of Banco de Portugal, since 1995. He has a Ph.D. in Economics from the University of Minnesota. His research interests are Macroeconomics, Monetary Economics, Game Theory and Financial Economics. He has published work in the Journal of the European Economic Association, Review of Economic Studies, Annales D’Économie et de Statistique, Applied Financial Economics and Review of Economic Dynamics.

[Abstract] Typically inequality is not taken into account to assess the effects of policy changes over aggregate variables. We study the decline of inflation and show that the efficiency effect of the decline can be larger, than what is usually reported, when inequality is considered. More-over, the decline of inflation improves equality in the economy.
